DESIGN

With over 25 years of experience in design, we have developed solutions for very satisfied customers in various fields. The added value that our customers appreciate lies in the continuous development of our methods - from scheduling to rapid parts procurement and testing to final assembly with instruction preparation and joint commissioning. The individual components, assemblies, special machines, test stands and fixtures we develop are designed with the utmost care - and are, of course, CE-compliant. Whether feasibility studies, detailed developments up to series production readiness, design and manufacture of small series or prototype construction - with our comprehensible project documentation and open communication, we are always close to our customers, who are kept up to date at every stage of the project. Together with our customers and partners, we also carry out research projects for the further development of existing products such as special machines or solve existing tasks with our approaches.

TOGETHER INTO THE CO₂-NEUTRAL FUTURE!
